Are you getting better with age? Maybe! But what about your mind?

The brain needs fuel in order to continue supplying us all the knowledge and memories we have stored there. Over time, just as our bodies slow down, so does the fuel supply to our brain, sometimes significantly.

WHERE DOES THE FUEL COME FROM?

Glucose provides the majority of the energy for a healthy brain to function.

Aging causes a reduction in cerebral metabolic rate for glucose [3], which is estimated to decline by 6% per decade globally with most cerebral regions affected [4]...

This reduction could result in memory loss and a decline in cognitive thinking.
Captex® MCTs for Energy Supply

Remember that 3% Ketones? The brain can accept up to 66% of its energy from Ketones [3-6]. But how do we increase the level of ketones that our body produces? CAPTEX® Medium Chain Triglycerides! [7]

Feed your BRAIN!

As a matter a fact, studies show [7] that elevated ketones can be maintained with relatively low doses of MCT repeated several times a day.

In this study [7] MCTs were given to eight healthy adults for four weeks time. The dosage was gradually increased from 5g given three times per day during meals, to 7.5g given three times per day. As you can see, over this short four week period, mean plasma ketones increased significantly and it is estimated that the additional ketone development could contribute to up to 9% of whole-brain metabolism. That’s a quick energy supply!

### Regulatory

Medium chain triglycerides are common food ingredients and are permitted for food uses per previously submitted intended uses and levels. Please contact ABITEC for further information.

### Certifications, Registrations, Compliance

- GFSI-BRC Global Standard for Food
- ISO 9001
- Kosher and Halal
- ISO 14001 and OHSAS 18001
- Batch processes, quality practices, product recall and traceability drills
- Registered with FDA as required by the Food Safety Modernization Act
**CAPTEX® MCTs for Cognitive Improvement**

The use of a ketone promoting diet has shown promise for weight management, performance, and cognition. Several studies have been performed to describe the efficacy of MCTs for increasing ketones and for supporting cognitive function both in animals and humans.

### Increased Ketone Levels in Humans Consuming MCTs [10]

- Consumption of MCTs increased circulating ketones.
- Higher ketone values were associated with greater improvement in paragraph recall.
- MCT treatment improved performance on cognitive testing for subjects without the genetic marker for Alzheimer’s disease.

The oral supplementation of MCTs succeeded in raising ketone levels almost 8 times baseline level 90 minutes after consumption in both groups. Patients with Alzheimer’s disease without the genetic marker show cognitive improvements in response to the increase in ketones. These elevations were associated with better cognitive scores (indicated by a negative score) as a measure of mental status change and paragraph recall. Adapted from data in [10].

### More Efficient Learning Effects in Aged Dogs [9]

- The dogs supplemented with MCT showed significantly better performance in most of the test protocols (landmark discrimination learning ability, egocentric visual spatial function and attention) than the control group.
- The more difficult tasks showed greater effects of MCT supplementation compared with easier tasks.
- Those dogs supplemented with MCTs showed significantly elevated levels of ketones.

Aged Beagle dogs supplemented with MCTs have significantly higher levels of circulating ketones. Additionally, MCT supplemented dogs performed better on an attention task. As the number of distractions increased, aged dogs receiving MCTs in the diet performed the tasks with significantly fewer errors compared with aged Beagle dogs without supplementation (control). Adapted from data in [9].

### Improvement of Cognitive Function in Rats [8]

- Feeding MCTs for six weeks resulted in an increase in circulating ketones in both young and old animals.
- Cognitive function was improved in aged rats fed MCTs both under normal conditions and when challenged by reduced oxygen.

The T-maze test, used for general cognitive function, is based on the innate preference of animals to explore an area (an arm) that has not been previously explored (called alternations). The MCT supplementation in aged rats resulted in a higher alternation rate compared with aged control rats. Adapted from data in [8].
